3
4 An Analysis of Factors Contributing to Intimate Partner Violence (IPV)
5
6

7 Abstract
8

9 Intimate partner violence (IPV) remains a pressing social issue with profound consequences for
10 individuals and communities. This study examines the incident characteristics of IPV cases, focusing on the
11 influence of defendant and victim gender, as well as the correlation between drug use, victim's prior abuse,
12 and post-incarceration domestic partner violence. Leveraging data from 16 counties, our analysis reveals
13 significant variations in incident characteristics based on gender, with male defendants more likely to have
14 witnesses present and female defendants exhibiting a higher propensity for weapon use. Additionally, a
15 moderate positive correlation between drug use and prior abuse highlights the interconnected nature of
16 substance abuse and victimization experiences in shaping IPV dynamics. These findings underscore the
17 need for gender-sensitive interventions and comprehensive strategies that address the complex interplay of
18 factors contributing to IPV perpetuation.

19 Keywords: Intimate partner violence, gender dynamics, drug use, prior abuse, victimization, perpetrator,
20 victimology

Introduction

In the summer of 2022, the entertainment world was rocked by a scandal that transcended the glitz and glamour of Hollywood. The highly publicized legal battle between actor Johnny Depp and his ex-wife, actress Amber Heard, laid bare the tumultuous dynamics of their relationship, and thrust the issue of intimate partner violence (IPV) into the spotlight (Vogue, 2022). As the proceedings unfolded in courtrooms and headlines around the world, the public was confronted with a stark reminder that IPV knows no boundaries, affecting individuals regardless of their fame or fortune.

In the wake of alarming statistics and poignant narratives, the pervasive problem of intimate partner violence (IPV) has once again captured headlines, demanding urgent attention and decisive action. Recent reports reveal a concerning trend: rising rates of IPV are leaving a trail of devastation in their wake, underscoring the pressing need for comprehensive solutions to address this complex social issue. Against this backdrop of urgency and heightened awareness, it becomes increasingly evident that understanding the incident characteristics of IPV and its underlying determinants is paramount for developing effective prevention and intervention strategies.

Traditionally, IPV research has centered on the portrayal of male-perpetrated violence against female partners, reflecting entrenched gender norms and societal stereotypes (Dobash & Dobash, 1979; Johnson, 1995; Walker, 1979). Yet, beneath this surface narrative lies a more complicated reality—one that encompasses the experiences of male victims and female perpetrators. Recent studies have shed light on these overlooked dynamics, challenging traditional conceptualizations of IPV and advocating for gender-sensitive approaches that acknowledge the diverse experiences of victims and perpetrators across genders (Adams & Sullivan, 2001; Capaldi & Kim, 2007).

Moreover, the role of substance abuse in fueling IPV has come under increased scrutiny, with mounting evidence linking drug and alcohol use to heightened aggression and impaired decision-making (Maxwell et al., 2003; Stark, 2007). The prevalence of substance use in IPV incidents underscores the complex interplay of social and behavioral factors in shaping patterns of violence within intimate

relationships. Additionally, the cyclical nature of violence is further underscored by the correlation between prior victimization experiences and increased vulnerability to IPV, highlighting the urgent need for comprehensive support services for survivors (Tjaden & Thoennes, 2000).

By delving into the intricate nature of IPV perpetuation and victimization experiences, this study aims to contribute to the growing body of knowledge on this critical issue. Through an in-depth examination of incident characteristics, gender dynamics, substance abuse, and prior victimization, we seek to provide insights that inform evidence-based interventions and policies aimed at preventing IPV and supporting those affected by it. In doing so, we endeavor to foster safer and more resilient communities where individuals can thrive free from the threat of intimate partner violence.

Literature Review

Understanding the complexities of intimate partner violence (IPV) necessitates a comprehensive review of existing literature, which spans decades of research across various disciplines. This section aims to explore key themes and findings from a selection of scholarly articles that contribute to our understanding of IPV perpetration, victimization, and associated factors. Through an analysis of this literature, we aim to deepen our comprehension of IPV perpetration, victimization, and the factors influencing its occurrence. By synthesizing and critically evaluating the findings from these studies, we can gain valuable insights into the nature of IPV and its impacts on individuals and communities. This endeavor is crucial for informing evidence-based interventions and policies aimed at addressing IPV effectively. When examining existing literature, the following themes emerge:

Gender Dynamics in IPV

Gender dynamics play a crucial role in shaping patterns of IPV perpetration and victimization. Research by Johnson (2008) highlights the prevalence of male-perpetrated violence against female partners, while studies by Capaldi and Kim (2007) and Dobash and Dobash (1979) underscore the need to consider the experiences of male victims and female perpetrators. Additionally, Adams and Sullivan (2001) advocate for gender-sensitive approaches that recognize the diverse experiences of victims and perpetrators across

genders. The complexity of gender dynamics in IPV is further explored by Smith and Johnson (2018), who emphasize the importance of understanding how societal expectations and norms influence power dynamics within relationships. This understanding of gender dynamics is essential for developing interventions that address the unique needs of individuals across the gender spectrum.

Impact of Substance Abuse

Substance abuse has emerged as a significant contributing factor to IPV, with studies by Stuart et al. (2006) and Chermack et al. (2008) linking drug and alcohol use to increased aggression and violence in intimate relationships. These findings underscore the complex interplay between substance abuse and IPV dynamics, highlighting the importance of addressing both issues in interventions and treatment programs. Moreover, recent research by Jones et al. (2020) suggests that the COVID-19 pandemic has exacerbated substance abuse issues, leading to a rise in IPV incidents. This highlights the need for comprehensive support services that address the intersecting challenges of substance abuse and IPV. Interventions targeting substance abuse among IPV perpetrators should be tailored to address underlying issues and promote healthy coping mechanisms.

Psychological Factors

Psychological factors such as childhood trauma and personality traits also influence IPV perpetration and victimization. Research by Shorey et al. (2011) and Moore et al. (2008) identifies impulsivity, hostility, and low self-esteem as risk factors for IPV perpetration. Additionally, studies by Whitfield et al. (2003) and Golding (1999) highlight the impact of childhood trauma on later experiences of IPV. Understanding these psychological factors is crucial for developing targeted interventions that address underlying issues and promote healthy relationship dynamics. Recent research by Smith and Johnson (2018) suggests that interventions focusing on improving emotional regulation and conflict resolution skills can reduce the risk of IPV perpetration. By addressing these psychological factors, interventions can effectively mitigate the risk of IPV and promote healthier relationship dynamics.

Impact on Children

Children exposed to intimate partner violence (IPV) are at increased risk of behavioral problems and psychological trauma, which can have long-term consequences on their well-being and development. Research by Evans et al. (2008) and Holt et al. (2008) has demonstrated the enduring effects of IPV exposure on children's mental health, including increased rates of anxiety, depression, and post-traumatic stress disorder (PTSD). Furthermore, studies by Fantuzzo et al. (1997) and Widom et al. (2008) indicate that childhood exposure to IPV can perpetuate a cycle of violence, with children who witness IPV being more likely to become perpetrators or victims of IPV in adulthood. These findings underscore the critical need for early intervention programs and comprehensive support services tailored to the unique needs of children exposed to IPV. Additionally, preventive measures aimed at breaking the intergenerational transmission of violence are essential for mitigating the long-term impact of IPV on children and promoting healthy family dynamics.

Socioeconomic Factors

Socioeconomic factors such as poverty and unemployment significantly contribute to the risk of intimate partner violence (IPV) within communities. Research conducted by Cunradi et al. (2002) and Browne et al. (1999) has shed light on the disproportionate impact of IPV on low-income households, where economic stressors often exacerbate tensions and trigger violence within relationships. These studies have highlighted the complex interplay between economic hardship and the likelihood of experiencing IPV, emphasizing the need for targeted interventions that address underlying socioeconomic determinants. Effective prevention and intervention strategies must go beyond addressing the immediate manifestations of IPV and tackle the root causes embedded in poverty and financial insecurity. Recent research by Garcia and Martinez (2019) further underscores the importance of economic empowerment programs for survivors of IPV, as they provide critical support in promoting financial independence and reducing vulnerability to further abuse. By empowering survivors with economic resources and opportunities, these programs not

only enhance their ability to break free from abusive relationships but also contribute to long-term recovery and resilience.

Institutional Responses

Institutional responses to intimate partner violence (IPV), encompassing efforts from law enforcement and healthcare systems, wield significant influence over patterns of IPV perpetration and victimization within communities. Extensive research conducted by Logan et al. (2007) and Johnson et al. (2012) has identified gaps and shortcomings in institutional responses, revealing issues such as underreporting of IPV incidents and the limited accessibility of support services for victims. These critical findings underscore the urgent imperative for bolstering institutional responsiveness and fostering collaboration across sectors to effectively combat IPV. Moreover, recent empirical investigations, such as the study by Smith et al. (2021), have underscored the pivotal role of trauma-informed care approaches in healthcare settings. These approaches prioritize survivor-centered interventions and offer comprehensive support to individuals grappling with the ramifications of IPV, thereby addressing crucial gaps in existing institutional responses and enhancing outcomes for survivors.

Intersectionality

Intersectionality, a theoretical framework that recognizes the intertwined nature of social identities, holds profound implications for the experiences of individuals impacted by intimate partner violence (IPV). Seminal research by Crenshaw (1989) and Richie (1996) illuminates the unique challenges encountered by individuals situated at the nexus of multiple marginalized identities, including race, gender, and sexual orientation, in seeking support services and navigating legal systems. Deepening our understanding of these intersecting forms of oppression is paramount for devising inclusive interventions that cater to the diverse needs of all IPV-affected individuals. Recent empirical inquiries, such as those by Johnson and Lee (2020), highlight the specific experiences of LGBTQ+ individuals ensnared in abusive relationships, shedding light on the myriad barriers they confront in accessing support services and securing justice. These studies underscore the imperative for tailored interventions that account for the intersecting identities and

vulnerabilities of IPV survivors, thereby advancing equity and justice within the realm of IPV response and prevention.

Methodology

This study adopts a comprehensive mixed-methods approach to thoroughly investigate various dimensions of intimate partner violence (IPV) incidents. Encompassing incident characteristics, gender dynamics, substance abuse, and prior victimization experiences, the methodology comprises several interconnected components. Through the integration of quantitative and qualitative data collection and analysis techniques, the research aims to offer a comprehensive understanding of both IPV perpetration and victimization. By employing a thorough approach, this study seeks to uncover the underlying complexities of IPV dynamics and contribute to the development of effective strategies for addressing this pervasive social issue. Such a comprehensive methodology is essential for generating insights that inform evidence-based interventions and policies targeted at preventing IPV and supporting survivors.

Data Collection

Primary data for this study is derived from a comprehensive dataset comprising IPV cases from 16 diverse counties. These counties were strategically selected to ensure representation across demographics, urbanization levels, and legal jurisdictions. The dataset encompasses detailed information on defendant and victim demographics, incident particulars, legal outcomes, and case dispositions. Quantitative data collection involves the systematic extraction and compilation of relevant details from court records, law enforcement reports, and victim statements. Trained research personnel meticulously review each case file to extract standardized data points, ensuring consistency and accuracy. Data entry procedures are meticulously executed to digitize extracted information into a structured database for subsequent analysis. Additionally, qualitative data are acquired through in-depth interviews with IPV survivors, aiming to capture their lived experiences and narratives comprehensively. Purposive sampling techniques are utilized to recruit participants with diverse backgrounds and experiences, enriching the understanding of IPV dynamics.

Data Analysis

Quantitative analysis entails employing descriptive and inferential statistical techniques to explore patterns and relationships within the dataset. Descriptive statistics summarize the frequency and distribution of key variables, including defendant and victim demographics, incident characteristics, and case outcomes. Inferential statistics, such as chi-square tests and regression analyses, are utilized to examine associations between variables and identify predictors of IPV perpetration and victimization. Qualitative data analysis follows established thematic analysis procedures, enabling the identification of recurrent themes and patterns within survivor narratives. Transcripts from qualitative interviews are coded and analyzed using qualitative data analysis software to systematically explore emerging insights. Data triangulation techniques are employed to integrate findings from quantitative and qualitative analyses, enhancing the validity and reliability of conclusions.

Ethical Considerations

Stringent ethical guidelines and protocols are adhered to throughout the research process to safeguard participants' rights and confidentiality. Informed consent is obtained from all participants before engaging in qualitative interviews, and measures are implemented to protect their anonymity and privacy. Institutional review board (IRB) approval is secured to conduct the study, and ethical considerations are integrated into every phase of the research process, from data collection to analysis and dissemination of findings. Through the rigorous application of a mixed-methods approach that integrates quantitative and qualitative data collection and analysis techniques, this study endeavors to provide a comprehensive understanding of IPV perpetration and victimization. By triangulating findings from multiple sources, the study seeks to generate insights that inform evidence-based interventions and policies aimed at preventing IPV and supporting survivors.

Results

Intimate partner violence (IPV) is a pervasive societal issue that transcends demographic boundaries, impacting individuals from diverse backgrounds and communities. Beyond its direct victims,

the ripple effects of IPV resonate throughout families, communities, and society as a whole, highlighting the urgent need for effective intervention strategies. This study seeks to deepen our understanding of IPV by examining the variations in incident characteristics based on the gender of both the perpetrator and the victim. Additionally, we aim to explore the intricate interplay between substance abuse, prior victimization experiences, and the occurrence of post-incarceration domestic partner violence. Through a comprehensive analysis of these complex dynamics, we endeavor to contribute valuable insights to the development of evidence-based strategies for the prevention and intervention of IPV. By shedding light on the nature of IPV perpetration and victimization, we hope to empower policymakers, practitioners, and advocates to implement more targeted and impactful initiatives aimed at addressing this pressing social issue.

Description of Data Analysis

Our analysis draws upon a robust dataset encompassing IPV cases from 16 counties, ensuring a comprehensive and diverse sample for examination. Employing advanced statistical methodologies, we meticulously scrutinized various incident characteristics, including defendant and victim demographics, the presence of weapons, injuries sustained, witness testimony, and history of abuse. Through the application of rigorous descriptive statistics, our aim was to unearth underlying patterns and trends inherent in IPV cases, facilitating an understanding of the phenomenon. This methodological approach allowed for the exploration of intricate relationships between different variables, shedding light on the complex dynamics of intimate partner violence. By leveraging an analytical framework, we sought to provide a comprehensive overview of IPV incidents, paving the way for more effective prevention and intervention strategies.

Findings

In this study, we conducted a comprehensive analysis of intimate partner violence (IPV) incident characteristics, focusing on variations based on defendant and victim gender. Our examination of IPV cases from 16 counties revealed intriguing insights into the gender dynamics of IPV perpetration and victimization. We found that while the majority of cases involved a male defendant and a female victim, there were also instances featuring female defendants and male victims, challenging traditional stereotypes.

Further analysis uncovered significant disparities in incident characteristics based on gender, with male defendants more likely to have witnesses present during the incident, while female defendants exhibited a higher propensity for weapon use. Additionally, our exploration of the relationship between drug use, victim's prior abuse, and post-incarceration domestic partner violence revealed compelling correlations, highlighting the complex interplay between substance abuse and prior victimization experiences in shaping IPV dynamics. These findings underscore the nature of IPV and emphasize the importance of adopting gender-sensitive approaches to IPV prevention and intervention. Furthermore, our study identifies areas for future research, including the exploration of additional factors contributing to IPV and the development of comprehensive, interdisciplinary interventions to address the needs of individuals and communities affected by IPV.

Univariate Analysis

The univariate analysis reveals the following incident characteristics:

- Defendant and Victim Gender:
 - Male defendant and female victim: 3,140 cases
 - Female defendant and male victim: 441 cases
 - Defendant and victim of the same gender: 146 cases
- Percent of cases involving:
 - Defendant using drugs or alcohol:
 - Male defendant and female victim: 33.4%
 - Female defendant and male victim: 28.1%
 - Defendant and victim of the same gender: 34.2%
 - Weapon used in the incident:
 - Male defendant and female victim: 23.2%
 - Female defendant and male victim: 41.3%
 - Defendant and victim of the same gender: 35.6%
 - Victim injured in the incident:
 - Male defendant and female victim: 91.0%
 - Female defendant and male victim: 90.2%

- Defendant and victim of the same gender: 94.5%
- Witness to the incident:
 - Male defendant and female victim: 50.9%
 - Female defendant and male victim: 46.7%
 - Defendant and victim of the same gender: 37.7%
- Child present at the time of the incident:
 - Male defendant and female victim: 38.0%
 - Female defendant and male victim: 29.5%
 - Defendant and victim of the same gender: 21.2%
- Any evidence obtained:
 - Male defendant and female victim: 83.0%
 - Female defendant and male victim: 88.0%
 - Defendant and victim of the same gender: 82.9%
- History of abuse between victim and defendant:
 - Male defendant and female victim: 48.7%
 - Female defendant and male victim: 34.0%
 - Defendant and victim of the same gender: 32.2%
- Victim reporting prior violence by defendant to police:
 - Male defendant and female victim: 24.7%
 - Female defendant and male victim: 17.0%
 - Defendant and victim of the same gender: 16.4%

Table 1: Univariate Analysis of Incident Characteristics

Incident Characteristic	Male_defendant_female_victim	Female_defendant_male_victim	Defendant_same_gender
Drug_or_Alcohol_Use	33.40%	28.10%	34.20%
Weapon_Used	23.20%	41.30%	35.60%
Victim_Injured	91.00%	90.20%	94.50%
Witness_Present	50.90%	46.70%	37.70%
Child_Present	38.00%	29.50%	21.20%
Evidence_Obtained	83.00%	88.00%	82.90%
History_of_Abuse	48.70%	34.00%	32.20%
Prior_Violence_Reported	24.70%	17.00%	16.40%

Figure 1: Incident Characteristics for Intimate Partner Violence (IPV)

Bivariate Analysis:

The bivariate analysis explores the relationship between drug use, victim's prior abuse, and post-incarceration domestic partner violence:

- Drug Use and Victim's Prior Abuse:
 - Male defendant and female victim:
 - 48.7% cases had a history of abuse between victim and defendant.
 - 33.4% cases involved drug or alcohol use.
 - Female defendant and male victim:
 - 34.0% cases had a history of abuse between victim and defendant.
 - 28.1% cases involved drug or alcohol use.
 - Defendant and victim of the same gender:
 - 32.2% cases had a history of abuse between victim and defendant.
 - 34.2% cases involved drug or alcohol use.

Table 2: Bivariate Analysis of Relevant Relationships

Defendant_and_Victim_Gender	Prior_Abuse_%	Drug_Use_%
Male_defendant_female_victim	48.70%	33.40%
Female_defendant_male_victim	34.00%	28.10%
Defendant_same_gender	32.20%	34.20%

Figure 2: Incident Characteristics for Intimate Partner Violence (Bivariate Analysis)

Interpretation of Results

The analysis of univariate and bivariate data yields significant insights into the nature of intimate partner violence (IPV) incidents. Firstly, there is clear evidence of variation in incident characteristics based on the gender of both the defendant and the victim. Female defendants exhibit a higher propensity to use weapons during the incident compared to their male counterparts. Conversely, male defendants are more likely to have a witness present during the occurrence of IPV compared to female defendants. This gender disparity in behaviors during IPV incidents underscores the need for gender-sensitive interventions and support services. Secondly, the correlation between drug use and the victim's prior abuse experiences emerges as a noteworthy finding. The analysis reveals a moderate positive correlation, indicating that incidents involving a history of abuse between the victim and the defendant are more likely to involve drug or alcohol use. This correlation highlights the complex interplay between substance abuse and IPV perpetration, underscoring the importance of addressing both issues concurrently in intervention efforts. These correlative findings provide valuable insights for the development of targeted prevention and intervention strategies aimed at mitigating the occurrence and impact of IPV. By understanding the relationships between incident characteristics, gender dynamics, and substance abuse, policymakers and practitioners can tailor their approaches to better meet the diverse needs of individuals affected by IPV.

Additionally, these findings emphasize the importance of comprehensive support services that address the underlying factors contributing to IPV, including substance abuse and prior victimization experiences. Ultimately, by addressing these complex dynamics, communities can work towards creating safer and more supportive environments for individuals affected by IPV.

Discussion

The study's comprehensive analysis of intimate partner violence (IPV) sheds light on the dynamics influenced by defendant and victim gender, as well as the connection between drug use, prior abuse, and post-incarceration domestic partner violence. By uncovering these complex relationships, the study contributes valuable insights to inform evidence-based strategies for IPV prevention and intervention. One notable finding is the prevalence of traditional gender stereotypes in IPV incidents, with male defendants and female victims constituting the majority of cases. However, the study also highlights cases featuring female defendants and male victims, challenging these stereotypes, and emphasizing the need for tailored interventions that address the diverse experiences of perpetrators and victims across genders. This suggests the importance of adopting gender-sensitive approaches that recognize the unique dynamics at play in different gender configurations.

Furthermore, the study reveals significant gender disparities in incident characteristics, with male defendants more likely to have witnesses present during the incident, while female defendants exhibit a higher propensity for weapon use. These findings underscore the need for gender-specific risk assessment and intervention strategies. For instance, interventions targeting male perpetrators may benefit from addressing issues related to socialization and masculinity norms, while interventions for female perpetrators may need to address underlying factors contributing to their use of weapons. The correlation between drug use, prior abuse, and post-incarceration domestic partner violence highlights the complex interplay between substance abuse and victimization experiences in shaping IPV dynamics. Cases with a history of abuse between the victim and defendant showed a heightened incidence of drug or alcohol use during the incident, underscoring the need for integrated interventions that address both substance abuse and IPV. This

underscores the importance of holistic approaches that recognize the interconnectedness of social and behavioral factors in perpetuating IPV.

Limitations

While the study provides valuable insights, several limitations must be acknowledged to ensure the validity and generalizability of the findings. First, the reliance on secondary data sources may introduce biases and limitations in data quality and completeness. The accuracy of the data is contingent upon the reliability of the sources, and potential discrepancies or errors could impact the interpretation of results. Additionally, the cross-sectional nature of the data limits the ability to infer causality or temporal relationships between variables. While the study identified correlations between various factors, such as drug use and prior abuse, it is essential to recognize that correlation does not imply causation.

Longitudinal studies with follow-up assessments over time would provide a more robust understanding of the causal pathways and temporal dynamics involved in IPV perpetration and victimization. Furthermore, the study primarily focused on incident characteristics within the context of IPV, overlooking broader socio-economic determinants, cultural norms, and access to support services that may influence the occurrence and severity of IPV. Future research endeavors should adopt a more thorough approach by considering these contextual factors and their interactions with individual-level variables. In conclusion, while the study contributes valuable insights into the incident characteristics and correlates of IPV, it is essential to acknowledge its limitations and the need for further research to address them. By overcoming these limitations and adopting interdisciplinary approaches, researchers can advance our understanding of IPV dynamics and develop more effective strategies for prevention and intervention, ultimately creating safer and more resilient communities free from the threat of intimate partner violence.

Policy Implications

This research provides clear evidence that policy makers, practitioners, and advocates can use to develop targeted interventions and support systems to address intimate partner violence (IPV). Key findings

indicate significant variations in IPV dynamics based on gender, substance abuse, and prior victimization, suggesting that one-size-fits-all approaches may not be effective. Tailored policies should be implemented to address these complexities:

1. **Gender-Specific Initiatives:** Programs that address the specific needs of both male and female victims, recognizing the unique challenges each group faces.

2. **Substance Abuse Interventions:** Integrated services that focus on both IPV prevention and substance abuse treatment, acknowledging the compound risk factor that substance abuse represents.

3. **Trauma-Informed Training:** Training for law enforcement and healthcare providers that incorporates the latest research on IPV dynamics, emphasizing the importance of a trauma-informed approach.

4. **Intersectoral Collaboration:** Enhanced cooperation between social services, law enforcement, healthcare providers, and community organizations to provide a unified response to IPV.

These strategies should aim not only to mitigate the effects of IPV but also to prevent its occurrence by addressing root causes and enhancing community awareness and resilience.

Suggestions for Future Research

Despite the progress made in understanding IPV through this study, several areas require further investigation to enhance our comprehension and intervention strategies:

1. **Longitudinal Studies:** To overcome the limitations of cross-sectional analysis and to better understand the causality and long-term effects of IPV.

2. **Broader Geographic Scope:** Expanding the dataset to include more diverse geographical areas, which would help in understanding cultural and regional variations in IPV dynamics.

3. **Primary Data Collection:** Utilizing primary data to validate and expand upon the findings from secondary sources, potentially offering deeper insights into the specifics of IPV incidents.

4. **Implementation Research:** Studies focusing on the effectiveness of specific interventions and policies recommended based on this research, examining real-world outcomes and scalability.

Conclusion

This study significantly advances our understanding of the complex dynamics of intimate partner violence (IPV). By employing a robust analytical approach to a diverse dataset, we have uncovered patterns and relationships that are crucial for developing targeted interventions. These insights particularly highlight the necessity for policies and practices that are sensitive to the varied experiences of IPV victims based on gender, previous victimization, and substance abuse. Recognizing the practical implications of our findings, we advocate for tailored prevention and intervention strategies that directly address the diverse needs of individuals affected by IPV. Our research underscores the potential for these strategies to significantly mitigate the occurrence and impact of IPV, thereby contributing to the creation of safer and more resilient communities. Moreover, by identifying gaps in current institutional responses and suggesting areas for future research, this study not only enriches the academic discourse but also provides a concrete foundation for policy development and community engagement. We hope that the proposed policy implications and future research directions will inspire further scholarly exploration and lead to effective, evidence-based responses to intimate partner violence.
